Tesla

22 July 2026 · the qualitative

$376.71

NASDAQ : TSLA · Mature-Company DCF

$1413.57B mkt cap · 3.75B sh · $44.1B cash, $1.6B debt · $44.1B cash vs ~$1.6B debt (~$42.5B net cash); ~3,752M shares; Revenue $94.8B FY25 (-3%, second down year); GAAP op margin compressed to 4.6% (from 16.8% in 2022); FCF ~$6.2B; ~$406 (down ~10% YTD, +27% TTM); ~$1.5T market cap trades on the autonomy/robot narrative, not auto fundamentals

THE CENTRAL QUESTION

At ~$1.5T on a declining ~$95B auto base earning 4.6% margins, does the price hold on auto+energy fundamentals, or only if unsupervised autonomy and Optimus ship into real revenue?

Tesla trades at ~$1.5T (~$406, +27% TTM) - ~16x EV/sales on $94.8B revenue that fell ~3% in FY25, the second straight delivery decline (1.64M, -8.6%), with GAAP operating margin compressed to 4.6% from 16.8% in 2022. The DCF underwrites only the auto+energy cash flows; on those fundamentals the weighted finding is ~$101 (-75%). The robotaxi/FSD/Optimus optionality is real but lives entirely in the ultra-bull second act, and even that lands -6%. What you pay above ~$100 is the autonomy/robot option, not the car business - the modal case, an auto maker re-rating toward an auto multiple, is deeply negative.

PROBABILITY-WEIGHTED EXPECTED VALUE

$101.42 expected fair value today

-73.1% vs spot $376.71

FORWARD COMPOUNDED VALUE

+5y	+10y	+15y	+20y
$161.20	$256.45	$408.36	$650.87

Tesla scenario narratives

PROBABILITY WEIGHTS

Ultra Bear 18% Bear 30% Base 30% Bull 14% Ultra Bull 8% · Weighted expected $101.42 (-73.1% vs spot)

ULTRA BEAR $26.42

-93.0% vs spot

Probability 18%

Deliveries keep falling; pure auto multiple.

WHY 18%

The fundamentals-only floor: two straight delivery declines, Q1'26 FCF negative, beats leaning on warranty true-downs and tariff relief, and the moonshots still slipping. 18% weight on the auto franchise simply re-rating to an auto multiple.

WHAT HAPPENS

The auto base keeps eroding: deliveries fall again as BYD/VW take share and Europe stays depressed (EU registrations -17%, 13th straight monthly decline), the affordable Model Q slips further, and price cuts hold operating margin near the depressed 4.6%. None of robotaxi, unsupervised FSD, or Optimus reaches material revenue inside the window.

A shrinking car maker with single-digit margins earns a low-double-digit FCF / mid-single EV/sales multiple - DCF ~$26 (-93%). Even ~$42.5B net cash is immaterial against a ~$1.5T price built on optionality that doesn't arrive.

BEAR $46.40

-87.7% vs spot

Probability 30%

Auto stabilizes; energy grows; no autonomy revenue.

WHY 30%

The plausible 'auto recovers, robots don't ship in time' path: energy is genuinely compounding and margins can heal, but autonomy keeps slipping (v15 to summer, unsupervised FSD to Q4 at earliest). 30% as the central fundamentals outcome.

WHAT HAPPENS

Deliveries stop falling and resume mid-single-digit growth as the Model Q finally ships, energy storage keeps compounding (+25% YoY, high-margin), and operating margin recovers toward 9% - a respectable car-plus-energy business, but FSD stays supervised and robotaxi stays a ~20-34-vehicle pilot, so no autonomy revenue enters the model.

DCF ~$46 (-89%) - even a healthier auto+energy franchise at a premium auto multiple (~14-16x FCF) is worth a fraction of today's price; the gap is the un-modeled optionality, not the car business.

BASE $83.38

-77.9% vs spot

Probability 30%

Growth resumes; margins heal; autonomy begins.

WHY 30%

Requires the auto base to inflect AND margins to recover AND early autonomy revenue - credible given the product pipeline and FSD-data flywheel, but each leg is currently slipping. 30% as the central, still-deeply-negative outcome.

WHAT HAPPENS

Volume re-accelerates to low-teens as the affordable model expands the addressable market and energy scales, lifting operating margin back toward the mid-teens; FSD monetization and an early robotaxi ramp begin to contribute, so the business carries a richer-than-auto multiple - but the second act is just starting, not at scale.

DCF ~$83 (-79%) - the modal case. A re-accelerating Tesla with healing margins and the first autonomy dollars is worth far more than the bear, yet still ~four-fifths below spot, because even this constructive fundamentals path doesn't justify ~$1.5T.

BULL $193.76

-48.6% vs spot

Probability 14%

FSD ships; robotaxi scales; software margins.

WHY 14%

The Power-gated second act: durable FSD-data process power plus the robotaxi/licensing model, if autonomy actually ships and scales. Real but every 2026 datapoint shows it slipping. 14% weight on the platform thesis landing within the window.

WHAT HAPPENS

Unsupervised FSD clears regulators and ships, the robotaxi fleet scales out of pilot into real ride-hail revenue, and high-margin software/licensing lifts blended operating margin toward 20% on >20% revenue growth - the platform repricing the autonomy bulls underwrite. Optimus and energy add to a real second revenue stream.

DCF ~$194 (-52%) - the first scenario where a genuine software/autonomy platform multiple (~19-24x FCF) is in the numbers, yet the entry price still embeds more than this delivers; the autonomy win is necessary but, at ~$1.5T, not sufficient.

ULTRA BULL $382.51

+1.5% vs spot

Probability 8%

Robotaxi, Optimus, energy compound; platform.

WHY 8%

Everything ships and scales - robotaxi AND Optimus AND energy AND a platform re-rate, the autonomy bull's complete thesis. ~8%, the long-duration tail that the current price already embeds.

WHAT HAPPENS

The full second act: unsupervised autonomy scales nationally into a high-margin ride-hail + FSD-licensing business, Optimus reaches volume as a non-auto TAM, and energy compounds - revenue grows ~30% at platform margins toward the mid-20s, the AI/robotics company the narrative prices.

DCF ~$383 (-6%) - only when ALL of robotaxi, Optimus, and energy compound into a true platform at a ~23-28x FCF multiple does the model approach today's price. That this best case still lands modestly below spot is the finding: ~$1.5T fully prices the moonshots succeeding.

Tesla 7 Powers · the moat, scored

Bear $46.40 Base $83.38 Bull $193.76

Arena. Global autos + autonomy/AI - Tesla (premium EV brand, FSD-data scale, energy storage) vs Toyota, BYD, Volkswagen in autos and Waymo and the autonomy/robotics field in the second act; auditing a branding + nascent process Power against auto-multiple compression.

POWER AUDIT
dominant-power durability: medium

POWER AUDIT · 7 POWERS

Scale Economies (3/3)
Real manufacturing scale (~1.6M units, gigacasting, vertically integrated batteries) and the largest charging network, but volume is now declining and below BYD.

Network Economies (1/3)
Supercharger access and fleet effects are mild; cars aren't a network - the FSD data flywheel is the closest thing and is counted as process power.

Counter-Positioning (1/3)
Was the EV disruptor legacy autos couldn't follow; now the incumbent being counter-positioned on price by BYD and on EVs by everyone.

Switching Costs (1/3)
Weak in autos (next car is a fresh decision); modest stickiness from Supercharging and the app/software ecosystem.

Branding · thesis leans here (3/3)
A genuine premium/technology brand with pricing power and a devoted base, but eroding in Europe (registrations -17%, 13th straight monthly decline) and politically polarized.

Cornered Resource (2/3)
Fleet-scale real-world driving data and battery/charging assets - valuable and hard to replicate, though contestable as rivals scale data and fast-charging.

Process Power (2/3)
Nascent and the bull's swing factor: manufacturing know-how plus the FSD-data/AI training loop - potentially durable if autonomy ships, unproven at unsupervised scale.

PEER SET

BYD — 20% gr · 6% mgn · ~20x P/E
Now the larger EV maker; cost leader taking global share, especially outside the US - the core auto-compression threat.

Toyota — 5% gr · 10% mgn · ~9x P/E
Scale/quality benchmark; hybrid-led, slow on EVs but vast cash generation - the mature-auto multiple Tesla is measured against.

Volkswagen — 2% gr · 5% mgn · ~4x P/E
Legacy scale leader pushing EVs hard in Europe, where Tesla's brand is weakening.

Waymo (Alphabet) — · private
Furthest-ahead robotaxi operator; the benchmark for whether Tesla's autonomy second act can actually scale.

THREAT VECTORS · FALSIFIERS

Branding · BYD / Volkswagen (price + EV share)
falsifier: Deliveries decline a third year as BYD/VW take share and Europe registrations keep falling.

Process Power · Waymo / autonomy slipping
falsifier: Unsupervised FSD and robotaxi keep slipping past 2027, so the data flywheel never converts to autonomy revenue.

Scale Economies · BYD cost leadership
falsifier: Operating margin stays below ~8% as price cuts continue and volume growth doesn't return.

COMPETITIVE READ

Tesla's strongest Power is its premium brand, backed by a nascent FSD-data process Power - but the brand is eroding in Europe, volume now trails BYD, and on the auto+energy fundamentals operating margin has compressed to 4.6% across two straight delivery declines. The Audit: branding is durable (medium) and process_power is the live swing factor (the autonomy flywheel), but the threat that dominates the cash flows is auto-multiple compression. The DCF underwrites only those fundamentals and lands ~-75%; the robotaxi/FSD/Optimus optionality sits entirely in the ultra-bull second act, and even full platform success lands -6% - so the ~$1.5T price embeds the moonshots succeeding, not the car business.

Tesla People · Opportunity · Context · Deal

Bear $46.40 Base $83.38 Bull $193.76

Underwrite the position the way a venture investor underwrites a round — across all four legs, public or private. **People** is the leg scored here (observable only); Opportunity, Context and Deal cross-reference the rest of the memo.

PEOPLE · WHO RUNS / OWNS / FUNDS IT

Elon Musk 18 yrs in seat

13% insider ownership

HIGH key-person risk

Capital allocation (realized)
No dividend, no buyback in company history; cash is plowed into capex and AI/compute. FY2024 capex ~$11.3B (~$5B AI); spend guided AI/robotics-tilted (~$20-25B/yr toward robotaxi, Optimus, compute). The in-house Dojo supercomputer was disbanded (Aug 2025) and compute outsourced to Nvidia/AMD/Samsung. Prior major M&A was the 2016 all-stock SolarCity buy (~$2.1B), a related-party deal (Musk was SolarCity chairman and largest holder) upheld entirely fair by Delaware (2022/2023). Stock-based comp is large and episodic via the CEO awards.

Incentive alignment
Base salary $0 since 2019; pay is 100% milestone stock options. The 2018 CEO Performance Award (options on ~304M split-adjusted shares at $23.34) hit all 12 milestones; rescinded by Delaware Chancery (Tornetta v. Musk, Jan 2024, ~$56B) then reinstated by the Delaware Supreme Court (Dec 2025); Musk exercised all ~304M options Jun 16 2026 (shares restricted, multi-year lockup). A 2025 interim award (96M shares) was forfeited once the 2018 award delivered. A new 2025 CEO Performance Award (up to ~423.7M shares, requiring up to an $8.5T market cap and milestones like 1M Optimus robots) was approved by ~75% of the vote Nov 2025.

GOVERNANCE FLAGS

- single class of stock (one share, one vote) — no super-voting; Musk ~13% direct economic stake (rises to ~20% after the Jun-2026 2018-award exercise, up to ~28-29% if all granted awards vest)
- Delaware Chancery rescinded the 2018 award (Tornetta v. Musk, Jan 2024) finding the board not independent of Musk on pay; reversed on appeal (Dec 2025)
- board-independence concerns: directors include brother Kimbal Musk and several long-time Musk associates; Musk + Kimbal recused from the 2025 award votes
- Chair separated from CEO since 2018 (Robyn Denholm is Chair; Musk remains CEO)
- related-party web among Musk entities: ~$573M of Tesla revenue from his companies in 2025 (xAI + SpaceX, per the 10-K/A)
- Musk attention split across xAI/X, SpaceX, Neuralink, The Boring Company, and a 2025 DOGE government role (stepped down May 2025)

THE FOUR LEGS

People ●●○○○
observable composite · 1–5

Opportunity
The scenario distribution · the business snapshot

Context
The 7 Powers analysis

Deal
Open-market common — entry price weighed against the probability-weighted fair value (the -75.0% finding — the robotaxi/FSD/Optimus optionality above ~$100 is priced explicitly, living in the ultra-bull second act) + position sizing.

> **PEOPLE READ**
> Founder-CEO economically concentrated (~13% direct, ~20% with the just-exercised 2018 award) on a single-class register, paired with the most-litigated executive-pay record in US corporate history (the Delaware Tornetta rescission then 2025 reversal; a new ~$1T award), a board with multiple Musk ties, a related-party transaction web across his companies, and attention divided over xAI/SpaceX/X.

Tesla supporting analysis · disclaimers · glossary

Bear $46.40 Base $83.38 Bull $193.76

PUSHBACK · WHY THE BASE CASE IS TOO HARSH

1 **The DCF ignores robotaxi/FSD/Optimus.**
Correct, and that is the point - those cash flows aren't in the auto+energy base, so they sit only in the bull/ultra-bull second act; what you pay above ~$100 IS that optionality, priced explicitly.

2 **Energy storage is real and compounding.**
+25% YoY and high-margin, and it is in the model (the Energy + Services segment) - but at ~26% of revenue it can't carry a ~$1.5T cap; even the bear builds energy in and lands -89%.

3 **Margins recovered to ~19% ex-credits in Q1'26.**
Auto GM ex-credits did recover, but the Q1'26 beat leaned on ~$230M warranty true-downs and tariff relief while FCF turned negative - margin quality, not just level, is the question.

4 **The FSD data flywheel is a real process Power.**
Granted - fleet-scale driving data is a genuine, hard-to-copy edge, which is why the bull/ultra-bull carry a platform multiple; the issue is timing, as unsupervised FSD slipped to Q4 2026 at earliest.

5 **Net cash, no solvency risk.**
$44.1B cash vs ~$1.6B debt (~$42.5B net cash) - immaterial against a ~$1.5T price; the downside is multiple/fundamentals, not survival; this is a valuation-vs-optionality memo, not a distress one.

FALSIFICATION TRIGGERS

Bull validation

unsupervised FSD ships to consumers · robotaxi fleet scales past pilot into paid ride-hail at scale · Optimus reaches volume production · auto deliveries return to growth with margin recovery

Bear validation

deliveries decline a third straight year · robotaxi stays a sub-100-vehicle pilot · unsupervised FSD slips beyond 2027 · operating margin stays below ~8% as price cuts continue

Reframe needed

if autonomy/Optimus ship and scale into material revenue, re-underwrite as a software/robotics platform (origination lens), not a mature auto maker - that is the only path that closes the gap to ~$1.5T

Do not make investment decisions on the basis of this document. Consult a licensed financial professional and read the company's official SEC filings (10-K, 10-Q, 8-K, proxy) before forming any investment view. If you wouldn't trust your retirement to a chatbot, don't trust this either.

GLOSSARY · CONCEPTS REFERENCED IN THE NARRATIVE

Robotaxi / FSD — Tesla's autonomous ride-hail (~20-34-vehicle pilot) and Full Self-Driving (unsupervised Q4'26+) - the auto-model optionality.

EV/sales — Enterprise value / revenue (~16x FY25); extreme for a ~3%-declining, 4.6%-margin auto maker - embeds autonomy optionality.

Optimus — Tesla's humanoid robot (V3 reveal pushed to ~Jul/Aug 2026, production 'quite slow') - a non-auto TAM only in the second act.

FCF margin — Free cash flow / revenue (~6.5% FY25); whether volume and margin recovery (and, in upper cases, software) convert to FCF.

Deliveries — Vehicles delivered per period; FY25 1.64M (-8.6%), the second straight annual decline, Tesla now smaller than BYD.
