Beam Therapeutics

$33.48

NASDAQ : BEAM · Young-Company DCF (Damodaran)

$3.45B mkt cap · 103M sh · $1.21B cash, $100M debt · $1.21B cash (Q1'26) vs ~$0.10B debt → net cash ~$11.75/share; runway to mid-2029; Pre-product base editing; FY25 collaboration revenue $139.7M; R&D burn ~$400M/yr; risto-cel SCD BLA as early as YE2026; BEAM-302 (AATD) pivotal cohort H2 2026

THE CENTRAL QUESTION

At ~$30 with ~$11.75/share of net cash, do the de-risked BEAM-302 (AATD) and risto-cel SCD programs make base editing a cheap option, or is clinical failure the likelier outcome?

Beam is a pre-product, clinical-stage base-editing biotech — it precisely rewrites a single DNA base with no double-strand cut. Revenue is lumpy collaboration income ($139.7M FY25); the op loss runs ~$400M/yr. The asset that matters is $1.21B cash (~$11.75/share, runway to mid-2029) plus a pipeline: risto-cel SCD (BLA as early as YE2026) and BEAM-302, the first in-vivo corrective editor, on an FDA-aligned accelerated path. The DCF asks whether the leads reach market before dilution erodes the equity. Weighted fair value is $39.38 vs $30 spot, +31% — asymmetric: the cash raises the floor, the de-risked data builds the right tail, clinical failure is the risk.

PROBABILITY-WEIGHTED EXPECTED VALUE

$39.38 expected fair value today

+17.6% vs spot $33.48

FORWARD COMPOUNDED VALUE

+5y	+10y	+15y	+20y
$61.81	$97.07	$152.53	$239.81
1.85× spot	2.90× spot	4.56× spot	7.16× spot

WEIGHTING RATIONALE

Ultra Bear 16% Leads fail; reverts to the ~$8 cash floor.
Bear 29% Risto-cel ships, slow vs Casgevy; one franchise.
Base 32% Both leads reach market; partial validation.
Bull 15% Both win; in-vivo platform scales to franchises.
Ultra Bull 8% Dominant in-vivo platform; several blockbusters.

Bull (15%) + Ultra Bull (8%) together contribute $29.79 — 76% of the $39.38 expected value despite 23% combined probability. Today's spot ($33.48) sits 15% below the weighted expected; forward-weighted value crosses spot between +5y and +10y.

Beam Therapeutics scenario narratives

PROBABILITY WEIGHTS

Ultra Bear 16% Bear 29% Base 32% Bull 15% Ultra Bull 8% · Weighted expected $39.38 (+17.6% vs spot)

ULTRA BEAR $5.77

-82.8% vs spot

Probability 16%

Leads fail; cash floor holds

WHY 16%

High clinical risk is real for a pre-product editing platform — in-vivo LNP safety and BEAM-302 durability are unproven. Weighted at 16%: a credible but not modal path, given two independent lead programs and a deep early pipeline.

WHAT HAPPENS

The lead programs fail in pivotal trials or a serious safety signal halts the in-vivo platform. FY35 product revenue is just $0.21B at a −15% op margin; p_fail is 80%. The company burns down toward its cash, and the going-concern value collapses to the operating business.

The standalone DCF is −$3.15/share, but the expected value is $5.77 because the rich $1.21B cash translates into an ~$8.00 distress floor — the cushion, not the pipeline, is what the holder recovers. This is the structural reason the downside is bounded rather than zero.

BEAR $7.12

-78.7% vs spot

Probability 29%

One franchise; slow vs Casgevy

WHY 29%

Weighted at 29%: partial success is plausible given risto-cel's durable fetal-hemoglobin data and NEJM publication, but slow launch economics against Casgevy and stalled in-vivo programs keep this a meaningful, near-modal outcome.

WHAT HAPPENS

Risto-cel reaches the SCD market but uptake is slow against an already-approved incumbent, and the in-vivo programs disappoint. FY35 product revenue is $0.74B at a 30% op margin; p_fail is 55%. A single franchise carries the company.

Reaching market requires ~$0.9B of dilutive raises before revenue scales, capping the equity return. The DCF is $6.04/share and the expected value $7.12 — better than the cash floor, but the platform thesis is unproven and the upside is one product deep.

BASE $20.65

-38.3% vs spot

Probability 32%

Both leads ship; partial validation

WHY 32%

Weighted at 32% — the modal outcome. It needs two independent programs to clear pivotal data and the first in-vivo corrective editor to commercialize, both plausible after the BEAM-302 Phase 1 readout but each individually uncertain.

WHAT HAPPENS

Risto-cel and BEAM-302 (AATD) both reach market, partially validating in-vivo base editing. FY35 product revenue is $1.50B at a 40% op margin; p_fail is 35%. The AATD accelerated-approval path on the AAT biomarker pays off, and a second modality proves the platform travels.

About $0.95B of pre-product raises land before revenue inflects around 2031, diluting the path but funding it through commercialization. The DCF is $27.46/share and the expected value $20.65 — the modal case sits near, then below, spot, so the value lives in the tails.

BULL $71.44

+113.4% vs spot

Probability 15%

Both win; platform scales

WHY 15%

Weighted at 15%: requires the platform to generalize across several in-vivo targets with durable correction and acceptable safety. A real path given the corrective mechanism and Pfizer/Lilly/Apellis partners, but it asks for sustained multi-program execution.

WHAT HAPPENS

Both lead programs succeed and the in-vivo LNP platform scales into multiple franchises beyond AATD — GSD1a (BEAM-301), PKU (BEAM-304), and partnered cardio programs. FY35 product revenue is $2.60B at a 43% op margin; p_fail drops to 18% as the platform de-risks across targets.

Demonstrated durability and a clean safety profile turn each new target into a repeatable shot rather than a one-off bet. The DCF is $85.37/share and the expected value $71.44 — this is where the editing-platform optionality starts to dominate the weighted value.

ULTRA BULL $238.40

+612.1% vs spot

Probability 8%

Dominant platform; blockbusters

WHY 8%

Weighted at 8%: the low-probability, high-magnitude outcome requiring base editing to win the in-vivo category outright over CRISPR-based rivals. Bounded by competition and the long durability record a category standard demands.

WHAT HAPPENS

Base editing becomes the dominant in-vivo gene-editing modality, with several blockbuster franchises across genetic disease. FY35 product revenue is $4.10B at a 46% op margin; p_fail is 8% as the platform proves broadly safe and durable, and the precise no-cut mechanism becomes the standard.

At this scale the company is a platform, not a product — repeatable single-base correction across a large target set with strong margins. The DCF is $258.43/share and the expected value $238.40, the franchise-platform tail that makes the overall distribution asymmetric-positive.

Sources: BEAM FY2025 10-K + Q1'26 10-Q (CIK 1745999), company runway guidance, BEAM-302 AATD Phase 1 data (Mar 2026), risto-cel BEACON (NEJM Apr 2026). Revenue is lumpy collaboration income; product revenue is modeled post-approval. FCF is NOL-shielded pre-tax over the explicit window. TAM: a serviceable slice of genetic-disease therapeutics, ~$30B.

Beam Therapeutics 7 Powers · the moat, scored

Bear $7.12 Base $20.65 Bull $71.44

Arena. In-vivo and ex-vivo gene editing for genetic disease, where Beam competes with Vertex/CRISPR, Intellia, CRISPR Therapeutics, and Editas.

POWER ORIGINATION
origination window: open

POWER ORIGINATION · 7 POWERS

Scale Economies	Manufacturing and trial scale matter, but Beam is pre-product and sub-scale versus the SCD incumbent today.
Network Economies	No network effect in therapeutics; demand does not compound with an installed base.
Counter-Positioning	No-cut base editing is positioned against CRISPR's genotoxic double-strand cut; incumbents cannot easily abandon their cutting approach.
Switching Costs	One-time curative dosing creates patient lock-in per franchise, but does not bind the next indication or prescriber.
Branding	NEJM data and platform reputation help, but prescribing follows clinical evidence, not brand.
Cornered Resource · thesis leans here	Foundational base-editing IP and the in-vivo LNP delivery toolkit are the resource Beam is trying to corner.
Process Power	A repeatable single-base correction process across targets is the Power being originated — unproven until durability replicates.

THE RACE · NAMED RIVALS

Vertex / CRISPR Therapeutics — Well-capitalized, marketed product
~35% terminal share · Casgevy: approved SCD incumbent, chemo conditioning, slow uptake

Intellia / NTLA — Funded, clinical-stage
~25% terminal share · In-vivo CRISPR editor; direct competitor for the in-vivo category

CRISPR Therapeutics / CRSP — Strong balance sheet
~15% terminal share · CRISPR platform breadth beyond Casgevy across multiple indications

Editas — Smaller cap, clinical-stage
~5% terminal share · Gene-editing peer, repositioning; smaller and earlier

LEAD / LAG · FALSIFIERS

In-vivo corrective editing	First in-vivo corrective Phase 1 readout (BEAM-302) vs Intellia in-vivo programs	LEADING
SCD commercialization	BLA-stage, not yet launched vs Vertex/CRISPR (Casgevy approved)	LAGGING
Editing precision / safety	No double-strand cut, durable HbF induction vs CRISPR cut-based platforms	LEADING

COMPETITIVE READ

Beam is trying to originate a cornered-resource and process Power in precise in-vivo editing — foundational base-editing IP plus a repeatable LNP correction process that, if it replicates, turns each genetic target into a shot on goal. The window is open: no rival has shown a durable in-vivo corrective edit. The falsifier the bull must clear is concrete — BEAM-302 must show durable AAT correction with a clean in-vivo safety profile, and risto-cel must launch differentiated against Casgevy. Without durability the resource is not yet cornered.

Underwrite the position the way a venture investor underwrites a round — across all four legs, public or private. **People** is the leg scored here (observable only); Opportunity, Context and Deal cross-reference the rest of the memo.

PEOPLE · WHO RUNS / OWNS / FUNDS IT

John Evans 9 yrs in seat

2% insider ownership

MEDIUM key-person risk

Capital allocation (realized)
Pre-product clinical-stage; the job is funding the platform without over-diluting. ~$1.2B cash (Mar 2026) funds operations into mid-2029, helped by a March 2025 ~$500M equity follow-on, a Feb 2026 Sixth Street $500M senior secured debt facility ($100M funded, the rest milestone-gated, non-dilutive), and the Pfizer collaboration ($300M upfront in 2022; Pfizer exercised its license option Dec 2025). Share count grew ~88M to ~103M. No buyback or dividend, appropriate at this stage.

Incentive alignment
CEO 2025 total comp ~$5.8M on a $755K base, the remainder predominantly equity. Insider Form 4 activity is routine 10b5-1 tax-withholding selling on RSU vesting (~$1.3M over the trailing year) with no open-market buying. Insider ownership is low (~75% institutional; CEO ~1%, scientific-founder stakes diluted from ~6-9% at the 2020 IPO) - the ~2% figure is approximate (the proxy group total was not separately sourced).

GOVERNANCE FLAGS

- single class of common stock, one vote per share
- independent Chair (Graham Cooper) separate from the CEO; 8-member board, 7 independent (~88%), all committees fully independent
- classified / staggered board (three classes)
- foundational base-editing IP is in-licensed from the Broad Institute / Harvard, and the scientific founders (Liu, Zhang, Joung) are affiliated with those institutions while holding founders' equity + consulting roles - an IP/related-party concentration; broader CRISPR-Cas patent-landscape FTO exposure is a sector risk
- no going-concern doubt (funded to mid-2029)

THE FOUR LEGS

People ●●●○○
observable composite · 1–5

Opportunity
The scenario distribution · the Page-3 business snapshot · the Arthur Indicator

Context
The 7 Powers analysis (Power Audit)

Deal
Open-market purchase = the deal: entry price vs. the scenario distribution (the +31.3% finding) + position sizing.

> PEOPLE READ
> Clean single-class one-vote register, an independent Chair (Cooper) split from a long-tenured professional CEO (Evans, since 2017), and a ~88%-independent fully-independent-committee board on a well-funded balance sheet (cash to mid-2029). Held at 3 by thin insider alignment (low ownership, sell-only Form 4s), a classified board, and the Broad/Harvard base-editing IP + scientific-founder related-party concentration. The platform depends on the founders' science (reputational) but none run day-to-day.

Beam Therapeutics supporting analysis · disclaimers · glossary

Bear $7.12 Base $20.65 Bull $71.44

PUSHBACK · WHY THE BASE CASE IS TOO HARSH

1 **Cash floor is real**
$1.21B cash (~$11.75/share) and runway to mid-2029 bound the downside — even the ultra-bear expected value is $5.77.

2 **BEAM-302 is de-risked**
The AATD Phase 1 data showed a working in-vivo corrective edit on the AAT biomarker, with an FDA-aligned accelerated path.

3 **Two independent shots**
Risto-cel (SCD) and BEAM-302 (AATD) fail or succeed on different biology, so partial success beats an all-or-nothing wipeout.

4 **No-cut mechanism**
Base editing avoids CRISPR's double-strand cut; Casgevy needs myeloablative chemo and carries a malignancy black-box — a differentiation lane.

5 **Self-funded to inflection**
Burn is heavy but funded; raises are dilutive, not existential — the risk is clinical, not insolvency.

FALSIFICATION TRIGGERS

Bull validation
BEAM-302 pivotal cohort shows durable AAT correction with clean safety; risto-cel BLA accepted and a differentiated SCD launch lands vs Casgevy.

Bear validation
BEAM-302 durability fades or an in-vivo LNP safety signal emerges; risto-cel launch stalls against the incumbent; raises come faster and larger than ~$0.95B.

Reframe needed
If cash falls toward the floor without a pivotal win, or a platform-wide safety class effect appears, the option re-rates toward the distress case.

Forward-looking statements.
Scenarios, valuations, projections, and any forward-looking statements involve substantial assumptions and uncertainty. Actual results may differ materially from those projected. Past performance is not indicative of future results. The model is a model; reality is not.

Author may hold positions.
The author may own, intend to acquire, or hold short exposure to $BEAM or related securities at any time. Positions may change without notice and without an update to this document. Do not assume the author's positions match the tone of the analysis.

Do your own research.
Do not make investment decisions on the basis of this document. Consult a licensed financial professional and read the company's official SEC filings (10-K, 10-Q, 8-K, proxy) before forming any investment view. If you wouldn't trust your retirement to a chatbot, don't trust this either.

GLOSSARY · CONCEPTS REFERENCED IN THE NARRATIVE

base editing — A precise single-base DNA rewrite that corrects a mutation without cutting both strands, avoiding the genotoxicity of a CRISPR double-strand cut.

risto-cel / BEAM-101 — Beam's ex-vivo base-editing therapy for sickle cell disease; durably induces protective fetal hemoglobin; BLA possible as early as YE2026.

BEAM-302 — An in-vivo LNP base editor for AATD that corrects the PiZ→PiM mutation — the first in-vivo corrective editor and the biggest swing factor.

AATD — Alpha-1 antitrypsin deficiency — a genetic disorder; the AAT protein level is the FDA-accepted accelerated-approval biomarker.

Casgevy — The Vertex/CRISPR Therapeutics approved SCD therapy — the incumbent — burdened by myeloablative chemo conditioning and a malignancy black-box warning.

p_fail — Modeled probability the scenario's programs fail to reach commercial value — the clinical/regulatory risk weight, high for a pre-product editing platform.
