Oklo

$45.21

NYSE : OKLO · Young-Company DCF (Damodaran)

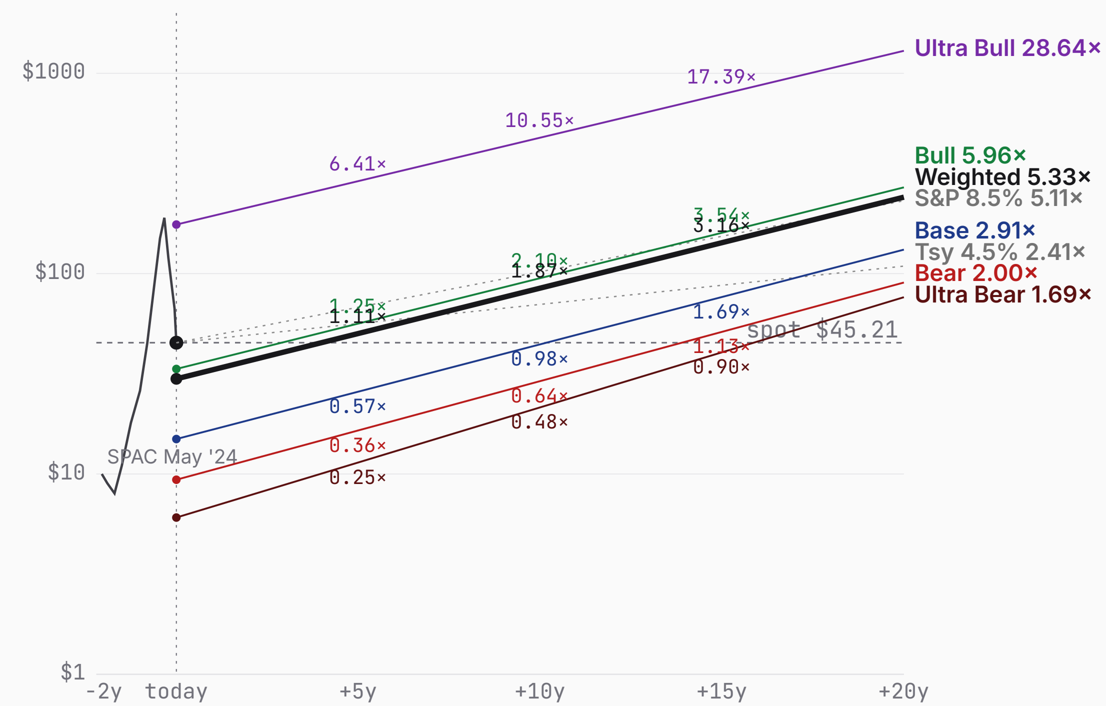
$8.14B mkt cap · 180M sh · $2.54B cash, zero debt · $2.54B cash, debt-free; zero warrants (174M basic / ~180M diluted); Pre-revenue; first Aurora power targeted 2027-28; ~14 GW pipeline (mostly non-binding); Equinix $25M prepay

THE CENTRAL QUESTION

Does ~$8B on zero revenue price a realistic path to a build-own-operate nuclear prime — or an AI-baseload-power outcome a decade of fundamentals can't reach?

Oklo trades at ~$8B on $0 revenue, against $2.54B cash and a ~14 GW (mostly non-binding) pipeline — a build-own-operate nuclear IPP (Aurora fast reactors sold as power; first power 2027-28; the first commercial advanced-fission site under construction). The DCF asks what deployed-GW scale, IPP margins, and — in the ultra-bull — a HALEU fuel-monopoly second act are plausible over a decade. The finding: base (~3 GW) and bull (~7 GW) sit below spot; only the ~8% ultra-bull (13 GW + fuel monopoly, +298%) clears it — the capital-intensive base leaves the weighted ~-34%.

PRICE + PROJECTIONS · HISTORICAL THROUGH PROBABILITY-WEIGHTED FORWARD



PROBABILITY-WEIGHTED EXPECTED VALUE

$29.84 expected fair value today

Oklo scenario narratives

PROBABILITY WEIGHTS

Ultra Bear 8% Bear 27% Base 34% Bull 23% Ultra Bull 8% · Weighted expected $29.84 (-34.0% vs spot)

ULTRA BEAR $6.06

-86.6% vs spot

Probability 8%

Aurora fails; NRC/FOAK setback; cash shell.

WHY 8%

The compound bear: a fast-reactor FOAK failure plus HALEU-fuel scarcity. DOE approved the Aurora-INL safety case (June 2026), so outright regulatory failure now requires the NRC to block the commercial fleet beyond INL — a narrower kill-path than at authoring, trimming this tail to 8%. 38% within-scenario failure reflects that Oklo, though cash-rich and debt-free, is pre-revenue and dependent on never-built technology.

WHAT HAPPENS

First-of-a-kind execution defeats Oklo — a sodium fast-reactor technical setback, a HALEU-fuel shortfall (the same constraint that slipped TerraPower), or an NRC re-denial blocking the commercial fleet beyond Idaho (the first plant proceeds under DOE authorization, with its safety cases approved mid-2026) pushes commercialization past 2030 or off the table. The build-own-operate model never reaches commercial power; Oklo subsists as a radioisotope (Atomic Alchemy) and services shell.

The $2.54B cash is the floor — but dilutive flailing raises and a decade of opex erode it, and a 38% within-scenario probability of restructuring pulls the expected toward the distress floor. Revenue stalls near $0.1B; the equity is worth a fraction of today's ~$8B.

BEAR $9.36

-79.3% vs spot

Probability 27%

Aurora slips; ~1 GW niche, capped.

WHY 27%

Aurora works but underwhelms on cadence and cost; the ~14 GW pipeline converts only fractionally as binding PPAs prove hard to land. 18% failure probability — lower than a pure science-project given $2.54B cash, DOE support, and a site under construction, but FOAK execution risk is real and datable — Oklo's Groves pilot unit missed its July 2026 criticality target while four DOE-pilot peers went critical. 27% weight as the very plausible 'competent but capped' outcome.

WHAT HAPPENS

Aurora certifies and powers up, but late (first power ~2029) and at low cadence; Oklo becomes a credible niche advanced-nuclear operator — ~1 GW deployed by the mid-2030s, real PPA revenue (~$0.8B by FY35) at solid IPP margins — but never converts the headline pipeline. FOAK costs run high and the factory-cost thesis only partly materializes.

Modest dilution funds the slow buildout. The DCF lands ~$10/share — the market is pricing a far larger, faster fleet. This is the 'real company, wrong price' world.

BASE $14.94

-67.0% vs spot

Probability 34%

First power ~2028; ~3 GW IPP fleet.

WHY 34%

Requires Aurora to work (not dominate) and the build-own-operate model to scale to a few GW — no full-pipeline conversion, no SpaceX-style runaway. 10% failure probability given the cash, DOE/INL momentum, and NRC progress (PDC topical report approved 2026). 34% weight as the central outcome.

WHAT HAPPENS

The modal path: Aurora reaches first power on roughly the targeted timeline (~2028), and Oklo scales the build-own-operate model to a ~3 GW operating fleet by 2034, selling baseload power to data centers at ~$75-90/MWh and ~50% mature operating margins — genuine IPP economics. FY30 revenue ~$0.42B sits near the (thin) analyst consensus, compounding as reactors come online.

The buildout is capital-intensive (~$2B/GW, ~$5.7B cumulative reinvestment) funded by ~$2.9B of dilutive raises on top of the $2.54B cash. DCF ~$15/share — ~66% below spot, a measure of how much the market is paying for a fleet larger and faster than a successful-but-rational base implies.

BULL $33.43

-26.1% vs spot

Probability 23%

Factory economics work; ~7 GW AI-power.

WHY 23%

A chain: Aurora works AND factory-cost economics materialize AND NRC clears AND the pipeline converts to binding PPAs at scale. Each plausible at 50-70%; jointly ~23%. A real, fundable trajectory — Oklo has the cash, the site, and the AI-power demand backdrop — but it is conjunctive.

WHAT HAPPENS

The bull: Aurora's factory-built economics prove out (capex per GW falls with cadence), NRC licensing clears, and Oklo converts a real slice of its pipeline — ~7 GW deployed by 2034, powering AI data centers under long-dated PPAs at scale, with fuel-recycling and radioisotope verticals adding optionality. Revenue compounds toward ~$4.8B at a ~58% operating margin.

Heavy but value-accretive raises fund the buildout; the business self-funds late. DCF ~$34/share — and still ~25% below spot. The bull case is genuinely good and still doesn't reach today's price on a 10-year fundamental basis; you must extend the horizon or believe a richer terminal.

ULTRA BULL $175.80

+288.9% vs spot

Probability 8%

13 GW power + HALEU fuel monopoly.

WHY 8%

Tail of tails: the build-own-operate model scales to ~13 GW AND Oklo originates a HALEU fuel-recycling monopoly AND integrates into the data-center load. Individually plausible at 30-50%; jointly ~3%. The fuel monopoly (a cornered resource) is the Power-gated second act; HALEU-supply scarcity is the falsifier that could make or break it.

WHAT HAPPENS

The tail (the second act): Oklo becomes the dominant AI-baseload-power IPP (~13 GW) AND originates a HALEU fuel-recycling monopoly — supplying fuel to the whole advanced-nuclear industry — AND moves up the stack into owning the data-center load. Revenue reaches ~$17.3B by FY35 at ~68% blended margins, with a platform terminal reflecting the originated cornered-resource Power.

DCF ~$180/share — equity ~$43B (a dominant AI-power IPP + fuel monopoly; ~2.5x sales). The exponential tail, +298% above spot: the fuel monopoly and owns-the-load economics are the second act the power-IPP base case doesn't capture.

Bear $9.36 Base $14.94 Bull $33.43

Arena. Advanced-fission power for AI data centers — Oklo (Aurora fast reactor, build-own-operate IPP, fuel recycling) vs NuScale, X-energy, Kairos, TerraPower, GE-Hitachi BWRX-300, Westinghouse eVinci; the race to originate the build-own-operate AI-baseload-nuclear position.

POWER ORIGINATION
origination window: open

POWER ORIGINATION · 7 POWERS

Scale Economies
Factory-built microreactors could reset capex/GW with cadence, but Aurora is pre-commercial — the learning curve is unbuilt.

Network Economies
A fleet/grid + fuel-recycling flywheel is a future moat, not yet originated.

Counter-Positioning
Build-own-operate (sell power, not reactors) + vertical fuel integration is hard for equipment-sale SMR peers to replicate without becoming IPPs themselves.

Switching Costs
20-40yr PPAs and co-located behind-the-meter reactors embed deeply once contracted (Equinix prepay a signal) — but most commitments are non-binding today.

Branding
A leading advanced-nuclear brand (Altman halo, DOE selection); strong but unproven on delivery.

Cornered Resource · thesis leans here
DOE site-use permit + INL site under construction + awarded fuel + Atomic Alchemy isotopes + DeWitte-led fast-reactor IP — a genuine first-mover physical lead. In the ultra-bull this extends to a HALEU fuel-recycling monopoly — the Power-gated second act.

Process Power
No operating reactor yet; the EBR-II heritage is design pedigree, not demonstrated process power.

THE RACE · NAMED RIVALS

NuScale — public; Fluor / ENTRA1
~20% terminal share · Only NRC-approved SMR design (LWR, 77 MWe VOYGR); deploys ~2030; Q1 2026 revenue $565K (-96% YoY); ~83% off peak.

X-energy — public (XE, IPO Apr 2026 @ $23, ~$1.0B gross); Amazon, DOE
~18% terminal share · HTGR 80 MWe TRISO pebble; Amazon 5+ GW by 2039; reactor early-2030s.

Kairos Power — DOE $303M; Google
~12% terminal share · Fluoride-salt KP-FHR; Hermes test reactor ~2027 (nearest demo); Google 500 MW.

TerraPower (Natrium) — >$3.4B; Gates, Nvidia, DOE
~12% terminal share · Sodium fast + molten-salt storage, 345 MWe; first NRC construction permit for a commercial non-LWR (Mar 2026); building at Kemmerer, WY; ops ~2030.

GE-Hitachi BWRX-300 — GE Vernova / Hitachi
~15% terminal share · BWR 300 MWe; OPG first unit ~2030; TVA Clinch River.

LEAD / LAG · FALSIFIERS

Commercial site under construction	Aurora-INL (ground broken Sep 2025, first) vs TerraPower Natrium (NRC permit Mar 2026; ground broken Apr 2026)	ROUGHLY LEVEL
NRC design / license status	COLA pending (denied 2022) vs NuScale design-approved	LAGGING
Operating reactor / demo	Groves pilot safety case approved Jul 2026; criticality pending vs four DOE-pilot microreactors critical by Jul 2026 (test units, not commercial plants)	LAGGING

COMPETITIVE READ

Oklo is originating a genuine build-own-operate AI-baseload-nuclear position — the first commercial advanced-fission site under construction (TerraPower's NRC-permitted Natrium joined it in 2026), a model that captures more value than equipment-sale SMR peers, $2.54B to fund it, and the structural AI-power demand pull. But it lags NuScale on design approval, has no operating reactor — its Groves pilot missed a July 2026 criticality target four DOE-pilot peers met — was denied once by the NRC, and its ~14 GW pipeline is overwhelmingly non-binding; first-of-a-kind execution and HALEU-fuel supply are the falsifiers the whole bull case must clear.

PEOPLE · WHO RUNS / OWNS / FUNDS IT

Jacob DeWitte · founder-led — 13 yrs in seat

12.2% insider ownership

HIGH key-person risk

Capital allocation (realized)
Co-founder Jake DeWitte is CEO and (since April 2025) Chairman; co-founder Caroline DeWitte (née Cochran) is COO and a director, re-elected June 2026 — the two are married and hold the top two operating roles plus board seats. Pre-revenue (the Aurora powerhouse is not yet operating): ~$2.5B cash at Q1 2026 against FY2026 guidance of ~$80-100M operating burn plus ~$350-450M capex, funded by heavy at-market issuance (the prior ATM facility fully utilized, ~$1.5B raised; a new $1B ATM established May 2026 via Goldman Sachs, BofA, Citigroup and J.P. Morgan — draws undisclosed until the Q2 10-Q). Customer demand is ~14 GW of non-binding letters of intent (Switch, Equinix, Meta). No dividend or buyback.

Incentive alignment
DeWitte's FY2025 compensation was ~$7M, equity-heavy and milestone-linked, on a modest ~$625K base. The founders retain a ~12.2% combined stake — meaningful alignment — but the only observed insider trading is programmatic selling (Rule 10b5-1); no open-market buying surfaced.

GOVERNANCE FLAGS

- single class of common stock, one vote per share — no super-voting; founders' voting power equals their ~12.2% economic stake (a positive)
- combined Chair & CEO (DeWitte since April 2025), mitigated by a lead independent director (Michael Thompson)
- classified / staggered board (three classes), directors removable only for cause — an entrenchment feature
- Sam Altman resigned as Chairman AND left the board entirely (April 2025) to clear an OpenAI conflict of interest; reported to retain equity (size not disclosed)
- the two co-founders are married and together hold the CEO, COO and two board seats — concentrated control and key-person exposure
- pre-revenue and funded by heavy equity dilution; customer commitments are non-binding letters of intent

Context
The 7 Powers analysis (Power Origination)

Deal
Open-market common — entry price weighed against the probability-weighted fair value (the -34.0% finding) + position sizing.

> PEOPLE READ
> A one-share-one-vote register (no super-voting) and a majority-independent board (8 of 9) with a lead independent director are the positives, and the founders are aligned via a ~12.2% stake. Holding it at 3 are a combined Chair/CEO, a classified board with for-cause-only removal, and control concentrated in two married co-founders who run the company and sit on the board. Key-person risk is high — pre-revenue, narrative- and regulatory-execution-dependent on the founders, with no commercial operations yet to diffuse it. Altman's full board exit removed a high-profile but conflicted chair.

Oklo supporting analysis · disclaimers · glossary

Bear $9.36 Base $14.94 Bull $33.43

PUSHBACK · WHY THE BASE CASE IS TOO HARSH

1 **Best-capitalized advanced-nuclear name.** $2.54B cash, debt-free, zero warrants — far more funded than SMR peers; dilution is opportunistic, not existential.

2 **First commercial advanced-fission site under construction.** DOE site-use permit + Aurora-INL groundbreaking (Sep 2025) — first mover on deployment; TerraPower's NRC-permitted Natrium joined it Apr 2026.

3 **Build-own-operate captures more value.** Selling power via PPAs, not reactors — recurring, higher-lifetime-value revenue vs equipment-sale SMR peers.

4 **Vertical integration is a hedge.** Fuel recycling + Atomic Alchemy radioisotopes add non-power revenue and a HALEU-supply hedge against the sector's fuel bottleneck.

5 **The demand pull is structural.** AI data-center power demand (33→176 GW US by 2035) plus the 400 GW US nuclear goal — the pull is real even if today's pipeline is non-binding.

FALSIFICATION TRIGGERS

Bull validation

Groves pilot criticality (missed Jul 2026 target) · first power on schedule (2027-28) · first binding PPA · Centrus fuel deal turns binding · factory capex < $2.5B/GW

Bear validation

first power slips beyond 2029 · COLA stalls at NRC (the first plant is DOE-authorized) · heavy ATM draws below ~$45 · pipeline stays non-binding / churns

Reframe needed

if factory-built capex approaches $1B/GW at cadence, the bull deployment ceiling lifts materially — revisit tam_share and the terminal

DISCLAIMERS · PLEASE READ BEFORE USING THIS DOCUMENT

Not investment advice.

This document is produced for entertainment and educational purposes only by an individual amateur investor. "Alameda Research 2: Electric Boogaloo" is the unincorporated personal concept of one person and is not a registered investment management entity. Nothing herein constitutes investment advice, a recommendation, or a solicitation to buy or sell any security.

Not a professional.

The author is not a registered investment advisor, broker-dealer, CFA charterholder, certified financial planner, or licensed financial professional of any kind. The author has no formal training in equity research or capital markets. No fiduciary relationship is created by reading this document.

AI-assisted analysis.

Substantial portions of this analysis were produced with the assistance of large language models. LLMs are known to fabricate facts, miscalculate numbers, hallucinate sources, and present incorrect information with high apparent confidence. Every figure, claim, and projection in this document should be independently verified before acting on it.

Forward-looking statements.

Scenarios, valuations, projections, and any forward-looking statements involve substantial assumptions and uncertainty. Actual results may differ materially from those projected. Past performance is not indicative of future results. The model is a model; reality is not.

Author may hold positions.

The author may own, intend to acquire, or hold short exposure to $OKLO or related securities at any time. Positions may change without notice and without an update to this document. Do not assume the author's positions match the tone of the analysis.

Do your own research.

Do not make investment decisions on the basis of this document. Consult a licensed financial professional and read the company's official SEC filings (10-K, 10-Q, 8-K, proxy) before forming any investment view. If you wouldn't trust your retirement to a chatbot, don't trust this either.

GLOSSARY · CONCEPTS REFERENCED IN THE NARRATIVE

Aurora Powerhouse — Oklo's sodium-cooled fast microreactor (15→50→75 MWe), metallic HALEU fuel, modeled on EBR-II; sold as power, not hardware.

Build-own-operate (IPP) — Oklo owns and runs the reactors and sells electricity via long-dated PPAs — an independent-power-producer model with recurring revenue.

HALEU — High-Assay Low-Enriched Uranium (5-20% U-235), the fuel advanced reactors need; supply is scarce — a sector-wide constraint.

COLA / NRC — Combined Operating License Application to the Nuclear Regulatory Commission; Oklo's 2022 COLA was denied without prejudice — the regulatory falsifier.

Sales-to-capital (s2c) — Damodaran reinvestment efficiency — incremental revenue per dollar of reinvested capital; low for capital-intensive nuclear (here ~0.2-0.6, implying ~$1.2-3B/GW capex).
