Serve Robotics

NASDAQ : SERV · Young-Company DCF (Damodaran)

$236M mkt cap · 77M sh · $197M cash, zero debt · ~$197M liquidity (~$47M cash + securities); ~1.2yr runway; burn ~$41M/qtr; ~2,050 robots deployed across 44 cities but only ~812 daily-active (<half utilized); FY26 guide $26M (~9x FY25); heavy dilution (24.8M → 77.4M shares in 2yr; $150M ATM)

22 October 2026 · the qualitative

$3.06

THE CENTRAL QUESTION

With a fleet of ~2,000 robots already built but fewer than half daily-active, is SERV a cheap option on utilization inflecting to profitable unit economics, or a dilutive grind where the modal case loses money?

Serve Robotics runs autonomous sidewalk delivery robots, spun out of Uber/Postmates and Nvidia-backed. It trades at $4.44 (~$342M cap), down ~57% YTD, on FY25 revenue of just $2.7M against a ~$41M/quarter burn — a pre-scale company with ~$197M of liquidity and ~1.2 years of runway. The build is done: ~2,050 robots sit across 44 cities, but only ~812 are daily-active — the question is utilization, not fleet size. Uber Eats (up-to-2,000-robot deal) and DoorDash demand exists to fill it, though no longer exclusively — Uber Eats now also routes to a rival fleet in Miami. The DCF weighted fair value is $6.77, +52% above spot — but the base case sits ~54% below the price, so the answer rides the right tail, paid for with relentless dilution.

PROBABILITY-WEIGHTED EXPECTED VALUE

Serve Robotics scenario narratives

PROBABILITY WEIGHTS

Ultra Bear 15% Bear 33% Base 30% Bull 17% Ultra Bull 5% · Weighted expected $6.77 (+121.3% vs spot)

ULTRA BEAR $1.11

-63.7% vs spot

Probability 15%

Utilization stalls; dilutive grind

WHY 15%

A 15% read. An 85% p_fail reflects that thin-margin delivery economics at sub-half fleet utilization rarely turn profitable before the cash and the live $150M ATM are exhausted.

WHAT HAPPENS

Daily-active robots stay stuck below half the deployed fleet, unit economics never clear the sub-$1/delivery bar, and Uber Eats and DoorDash volume fails to fill the built capacity. Revenue reaches only about $0.18B by FY35 at a 6% operating margin — sub-scale logistics economics that never earn their cost of capital.

With nothing to fund the burn, the auto-sized raises push the share count from ~77M toward ~276M, more than tripling the float. The DCF lands at ~$1.09; the $1.50 distress floor and residual liquidity drag the expected value to $1.11. The fleet exists, but the equity is diluted toward salvage.

BEAR $0.68

-77.8% vs spot

Probability 33%

Modest scaling; dilution offsets

WHY 33%

A 33% read, raised from 30% in Jul 2026 — the multi-sourced-platform world this scenario describes is now observed, with rival fleets taking platform volume inside Serve's own cities. A 55% p_fail captures partial commercial traction — Uber Eats and DoorDash contracts are signed and FY26 revenue is guided to ~$26M (~9x FY25) — against the risk that scaling stalls short of durable profitability.

WHAT HAPPENS

Utilization improves somewhat and a few markets reach reasonable density, but the network never becomes a self-sustaining engine. Revenue reaches about $0.42B by FY35 at a 12% operating margin — better than today, yet far short of the scale and cost-per-delivery needed to justify a platform valuation.

Continued burn forces heavy raises, lifting shares toward ~180M and offsetting most of the operating progress. The DCF is ~$0.33 and the expected value $0.68, both below spot. Real volume growth, but the per-share economics never outrun the dilution.

BASE $2.03

-33.7% vs spot

Probability 30%

Utilization inflects; still dilutive

WHY 30%

A 35% p_fail assumes the operating model works within the decade — supported by the demonstrated +578% revenue growth and the shift to utilization metrics — but still a coin-flip-plus that profitable unit economics arrive before dilution does the damage.

WHAT HAPPENS

Fleet utilization inflects — daily-active robots climb toward the deployed total, Uber Eats and DoorDash demand fills the built capacity, and cost-per-delivery falls toward the sub-$1 target so unit economics work. Revenue reaches about $0.70B by FY35 at a 15% operating margin as the network earns operating leverage on hardware that is already in the ground.

Growth still outpaces internal funding, so the company raises through the decade and shares drift toward ~146M. The DCF is $2.32 and the expected value $2.03 — both well under spot. The base outcome validates the operating model yet leaves the equity worth under half of today's price, because the dilution caps the per-share value.

BULL $14.58

+376.5% vs spot

Probability 17%

Delivery automation scales regionally

WHY 17%

A 15% p_fail. Requires utilized-fleet unit economics to turn durably profitable and the deployment to broaden regionally — anchored to the FY26 utilization and cost-per-delivery targets, which would be the first hard evidence the model scales.

WHAT HAPPENS

Autonomous delivery scales across whole regions — utilization runs high on a much larger fleet, the Magna manufacturing and Nvidia compute stack drives hardware cost down, and the Uber Eats and DoorDash channels compound volume. Revenue reaches about $1.50B by FY35 at a 20% operating margin as operating leverage on the built network finally shows.

Internal cash funds more of the growth, so dilution eases and shares settle near ~118M. The DCF is $16.89 and the expected value $14.58 — roughly three and a quarter times spot. This is the first scenario where the value of the network clearly exceeds the price paid plus the dilution to get there.

ULTRA BULL $65.84

+2051.6% vs spot

Probability 5%

DoorDash-scale delivery network

WHY 5%

A 5% read, trimmed from 8% in Jul 2026. The tail assumes the first-mover fleet plus Uber/DoorDash demand harden into a winner-take-most scale-economies Power later entrants cannot match — a gate that now has dated counter-evidence, with Avride live on Uber Eats inside Serve's Miami market, Coco entering D.C., and DoorDash advancing its in-house Dot robot. An 8% p_fail still governs the scenario's own path.

WHAT HAPPENS

Serve becomes a DoorDash-scale autonomous delivery network — on the order of ~7M deliveries per day — the default last-mile robotics layer for the food and goods platforms. Revenue reaches about $2.80B by FY35 at a 24% operating margin as network density and a first-mover fleet originate genuine scale economies.

Self-funding largely replaces dilution and shares settle near ~100M. The DCF is $71.44 and the expected value $65.84 — about fifteen times spot. This tail is where the bulk of the weighted value lives, and it depends on the fleet cornering last-mile delivery before rivals or the platforms' own autonomy close in.

POWER ORIGINATION
origination window: open

POWER ORIGINATION · 7 POWERS

Scale Economies ▰▱▱	A first-mover fleet could earn route density and hardware-cost scale, but unit economics at scale are unproven.
Network Economies ▰▱▱	Density helps reliability and cost, but value does not yet compound two-sidedly across users the way a marketplace does.
Counter-Positioning ▰▱▱	A robotics-native model the platforms are slower to build, but Uber and DoorDash are funding their own autonomy in parallel.
Switching Costs ▰▱▱	Multi-year platform deals create some stickiness, but the platforms demonstrably multi-source — Uber Eats now routes orders to Avride's rival fleet inside Serve's Miami market (Jul 2026).
Branding ▱▱▱	No consumer brand power; the order rides on Uber Eats or DoorDash, not the Serve name.
Cornered Resource · thesis leans here ▰▰▱	The Magna exclusive-manufacturing and Nvidia compute stack is the strongest candidate — contractual, not owned. The contracted Uber/DoorDash demand no longer counts as cornered — Avride acquired the same Uber Eats access inside a Serve city (Jul 2026).
Process Power ▰▱▱	An integrated build-and-operate workflow is distinctive but not yet shown to deliver profitably at scale.

THE RACE · NAMED RIVALS

DoorDash (in-house / Wolt) — DoorDash balance sheet

~0% terminal share · A core customer building its own autonomy and robots — partner and potential substitute

LEAD / LAG · FALSIFIERS

Robots deployed in commercial service	~2,050 across 44 cities vs Avride ~500 on Uber Eats, 5 US markets	LEADING
Profitable utilized-fleet unit economics	Unproven; targeting sub-$1/delivery vs Also unproven across the field	EVEN
Capital and balance-sheet depth	~$197M liquidity, dilution-funded vs Deeper (DoorDash, Amazon, Nuro)	LAGGING

COMPETITIVE READ

SERV is trying to originate a scale-economies plus cornered-resource Power — a first-mover commercial fleet, contracted Uber and DoorDash demand, and an exclusive Magna/Nvidia build stack — but no durable Power exists yet, because under half the fleet is utilized and unit economics at scale are unproven. The demand channel is demonstrably shared — Uber Eats routes to a rival fleet inside Serve's Miami market (Jul 2026) — so the contested moat is observed fact, not risk, and the platforms fund their own autonomy besides. The falsifier the bull must clear is utilized-fleet unit economics turning durably profitable — sub-$1/delivery on a high-utilization fleet — before dilution exhausts holders. Until that prints, the fleet is a built option, not a won Power, and the window stays open.

PEOPLE · WHO RUNS / OWNS / FUNDS IT

Ali Kashani · `founder-led` 5 yrs in seat

4.3%
insider ownership

HIGH
key-person risk

Capital allocation (realized)
Pre-profit sidewalk-delivery robotics - dilution is the story. The share count has grown ~15x in three years (~5M pre-SPAC to ~77M by May 2026; ~+36% in the trailing year) via a SPAC, warrants, a $150M ATM (terminated after ~$91M sold), and repeated follow-ons. Cash ~$106M (Dec 2025) / ~$47M (Mar 2026); ~$260M cash + securities at year-end 2025; operating burn ~$80M in FY2025 and ~$41M in Q1 2026 alone. Acquired Diligent Robotics (~$25.7M, 2026). No buyback or dividend.

Incentive alignment
Founder-CEO comp is overwhelmingly equity (FY2024 total ~$8.7M on a ~$237K base). Insider Form 4 activity is routine sell-to-cover on RSU vesting - no open-market buying and no large discretionary selling surfaced; the proxy states no insider pledging, margin accounts, or hedging.

GOVERNANCE FLAGS

- single class of common stock, one vote per share (no dual-class / super-voting) - a structural positive
- but a COMBINED Chair/CEO (Kashani) and a classified/staggered board (3 classes) concentrate leadership
- majority-independent board: only the two insiders (Kashani CEO, Parang President/COO) are non-independent
- related-party / commercial concentration: Uber (largest customer via an Uber Eats 2,000-robot deal, and a former >5% holder via Postmates, now ~3.4%; its autonomy head Maredia resigned from the board eff. Jun 17, 2026 — 8-K states no disagreement — replaced Jun 22 by independent director Andreas Lieber, so no sitting Uber executive remains), Magna (exclusive contract manufacturer), Nvidia (former supplier + ~10% holder, fully exited end-2024)
- going-concern doubt was flagged in the FY2023 10-K; cash is larger now (~12-month runway stated) but the FY2025 audit-opinion status was not independently confirmed

> **PEOPLE READ**
> A clean single-class one-vote register and a heavily equity-aligned founder-CEO are the positives. Held to a 3 by a combined Chair/CEO, a classified board, high key-person dependence on Kashani, the relentless dilution of a pre-scale cash-burner, customer/manufacturing concentration (Uber, Magna), and a going-concern history - the profile of an early, vision-driven company still proving its model.

The 7 Powers analysis (Power Origination)

Deal
Open-market common — entry price weighed against the probability-weighted fair value, then position-sized.
`+121.3% vs spot $3.06`

Serve Robotics supporting analysis · disclaimers · glossary

Bear $0.68 Base $2.03 Bull $14.58

PUSHBACK · WHY THE BASE CASE IS TOO HARSH

1 **The fleet is already built**
~2,000 robots across 44 cities are deployed; the spend is largely sunk, so utilization rising to profitability is operating leverage, not new capex.

2 **Anchor demand is contracted**
Uber Eats (up-to-2,000-robot multi-year deal) plus DoorDash give committed volume to fill the fleet — the demand side is signed, not speculative.

3 **Hyper-growth off a tiny base**
Revenue grew +578% YoY in Q1'26 and FY26 is guided to ~$26M (~9x FY25); management now reports utilization, not fleet size.

4 **De-rated price, fat right tail**
Down ~57% YTD, the equity is a cheap option — roughly 85% of the expected value sits in the bull and ultra-bull, priced lightly versus spot.

5 **A vertically-integrated stack**
Magna manufacturing, Nvidia compute, and the Diligent Robotics acquisition build a hardware-and-autonomy stack rivals must assemble from scratch.

FALSIFICATION TRIGGERS

Bull validation
Daily-active robots climb toward the ~2,050 deployed; cost-per-delivery falls through $1 (next checkpoint the Q3 report); Uber Eats scales toward the 2,000-robot commitment; raises shrink as revenue funds the burn.

Bear validation
Utilization still below half the fleet at the Q3 report; the FY26 ~$26M guide slips; a weak-terms raise (none filed through Jul 2026); a second Serve city shares volume with a rival fleet (Miami first) or Avride tops 1,000 robots.

Reframe needed
Utilized-fleet unit economics turn durably profitable and self-funding, shifting the story from option-on-fleet to cash-flow; or the cash and ATM exhaust before that, breaking the thesis.

DISCLAIMERS · PLEASE READ BEFORE USING THIS DOCUMENT

Not investment advice.
This document is produced for entertainment and educational purposes only by an individual amateur investor. "Alameda Research 2: Electric Boogaloo" is the unincorporated personal concept of one person and is not a registered investment management entity. AI-assisted analysis.
Substantial portions of this analysis were produced with the assistance of large language models. LLMs are known to fabricate facts, miscalculate numbers, hallucinate sources, and present incorrect information with high apparent confidence. Every figure, claim, and projection in this document should be independently verified before acting on it.

Forward-looking statements.
Scenarios, valuations, projections, and any forward-looking statements involve substantial assumptions and uncertainty. Actual results may differ materially from those projected. Past performance is not indicative of future results. The model is a model; reality is not.

Author may hold positions.
The author may own, intend to acquire, or hold short exposure to $SERV or related securities at any time. Positions may change without notice and without an update to this document. Do not assume the author's positions match the tone of the analysis.

Do your own research.
Do not make investment decisions on the basis of this document. Consult a licensed financial professional and read the company's official SEC filings (10-K, 10-Q, 8-K, proxy) before forming any investment view. If you wouldn't trust your retirement to a chatbot, don't trust this either.

GLOSSARY · CONCEPTS REFERENCED IN THE NARRATIVE

Daily-active vs deployed fleet — Robots actually running paid deliveries each day (~812) versus the total fielded (~2,000). The gap — under half utilized — is the central operational fact.

Unit economics / cost-per-delivery — The profit on a single delivery after labor, energy, hardware depreciation and operations. SERV targets sub-$1/delivery; clearing it is what makes the model work.

Operating leverage — Because the ~2,000-robot fleet is already built, additional deliveries on the same hardware drop largely to profit — so the model's value is highly sensitive to utilization.

Sales-to-capital (s2c) — How much new revenue each dollar of reinvested capital produces; it sets how fast revenue can grow before the company must raise fresh capital.

ATM dilution — An at-the-market equity program (here a live $150M ATM, May 2026, replacing the terminated Cantor ATM) that funds the burn by selling new shares — the source of the modeled share-count growth.

p_fail — The modeled probability the scenario ends in failure (utilization and unit economics never clear), driving the equity toward the $1.50 distress floor.
