

Baillie Gifford US Growth Trust

LSE: USA / OTC: BLGFF : BLGFF · Private \$1.13B mkt cap · 277M sh · \$0M cash, \$50M net debt · NAV \$4.61/sh (~344p), ~2-3% discount; Saba Capital Pre-Valuation (exit-scenario) ~29% — discount-control catalyst; ~30-40% private: SpaceX 16.5%, Anthropic 7.4%

\$4.25

last round mark · NAV 343.91p (Jun-2026); ~2-3% discount

THE CENTRAL QUESTION

Is the ~2-3% discount to a 343.91p NAV defensible against a probability-weighted distribution of NAV-realization outcomes over 3-4 years — when the easy re-rating is largely spent and the NAV itself leans on illiquid private marks (SpaceX at ~2× third-party fair value)?

USA is a closed-end US-growth trust whose share price (\$4.25) sits a few points below a 343.91p NAV (\$4.61). The dominant variable is not an operating DCF — there is no operating business, only a portfolio — but the NAV-realization distribution: you buy at a discount and "exit" by realizing NAV as the discount narrows and the book compounds over 3-4 years. The hook is the ~30-40% unlisted sleeve (27-28 names): SpaceX 16.5% and Anthropic 7.4% are ~24% of assets in two illiquid marks. Saba's ~29% activist stake has already compressed the discount from ~20% (2023) to ~2-3%, so the re-rating money is largely spent. The bear is not slow erosion but a 2022 redux — a growth drawdown plus stale private marks written down — with the discount re-widening. Probability-weighted PV lands ~\$4.18, ≈ the price. The single most consequential editorial input is the private-mark realism, not the discount. Five NAV-realization scenarios, weighted; show your work.

PROBABILITY-WEIGHTED EXPECTED VALUE

\$4.18
expected fair value today
-1.6% vs last mark \$4.25

WEIGHTING RATIONALE

- Crash Redux 12% 2022 redux — growth drawdown + private marks cut + discount re-widens to ~20%.
- Flat NAV 25% NAV treads water; discount drifts back to ~12% if buybacks slow or Saba exits.
- Compounder 38% Modal: NAV compounds ~10%/yr, discount holds ~5%; return is portfolio, not re-rating.
- SpaceX IPO 18% SpaceX lists at/above carry, marks crystallize, discount closes to par.
- Both IPO 7% SpaceX + Anthropic both IPO above carry; discount flips to a small premium.

SpaceX IPO (18%) + Both IPO (7%) contribute \$2 — 36% of the \$4 weighted PV despite 25% combined probability. The last round mark (\$4) sits 2% above the weighted PV, so secondary buyers paying through the mark are roughly justified. The venture discount rate is the load-bearing input — see Page 4 sensitivity.

Probability 12%	Probability 25%	Probability 38%	Probability 18%	Probability 7%
Growth crash; private marks cut. WHY 12% A growth drawdown, a private-mark reset, and a discount re-widening are correlated — the same risk-off regime drives all three — which is why the tail is fatter than for a single binary. Each is 30-45% plausible over three years; jointly ~12%. The 5-yr annualised NAV record (+3.9% vs benchmark +14.5%) proves the 2022-style drawdown is a lived outcome here, not a hypothetical, so the a-priori sits above a typical equity fund's. WHAT HAPPENS A 2022 redux. US growth equities draw down hard; the SpaceX 16.5% and Anthropic 7.4% marks — already rich (BG carries SpaceX at ~\$1.6T vs Morningstar's ~\$780B fair value) — get written toward third-party levels as a delayed IPO or down-round resets the carry. Net gearing (~3%) amplifies the fall. Saba, having compressed the discount, either exits or shifts tactics; with buybacks no longer enough to hold it, the discount re-widens toward the ~20% it carried in 2023 and the AIC North-America peer average (~20.8%). NAV falls to ~\$3.35/sh and the discount re-opens to ~20%, so the share-price "exit" lands near \$2.68 nominal in 2029 — discounted three years at the 9.5% fund required return, expected PV is ~\$2.04/share, roughly half today. No total-loss term: a diversified equity portfolio doesn't go to zero.	NAV flat; discount widens to ~12%. WHY 25% Modal-adjacent over three years. The activist overhang makes a full 2023-style blowout unlikely, but a drift to low-teens is easy if NAV stops compounding and buyback cadence slows. The realistic lever is Saba's posture — a tender or wind-down resolves the discount, but a quiet exit re-opens it. 25% reflects that "flat and re-widening" is a live, often-ignored middle. WHAT HAPPENS The "treads water" path. US growth de-rates modestly and the private sleeve is held flat — no SpaceX IPO to crystallize the carry, Anthropic marks paused — so NAV ends 2029 roughly where it started. With nothing compounding and Saba's presence less decisive (or its buyback firepower spent), the discount drifts back out to ~12% — wider than today but short of the 2023 blowout, since the activist overhang still caps it below the ~20.8% peer average. NAV holds near \$4.60/sh but a ~12% discount puts the share-price exit at ~\$4.05 nominal in 2029. PV at the 9.5% fund discount over three years: ~\$3.08 — meaningfully below today even though NAV barely moved, because the discount, not the portfolio, does the work. This is the underappreciated outcome: you can be right on NAV and still lose on the re-rating.	NAV +10%/yr; discount ~5%. WHY 38% Modal. Conditions: US growth compounds at a mid-cycle pace, no private-mark reset, the discount holds single-digit under continued buybacks. Each individually ~65-80%; jointly ~38%. This IS the base case but not overwhelming — the trust can slide into FlatNAV if buybacks slow or into the bull cases if a SpaceX IPO crystallizes the carry. WHAT HAPPENS The portfolio does its job. US growth holdings — Amazon, Meta, Shopify, Nvidia, Netflix, DoorDash — compound NAV ~10%/yr, the private sleeve holds or appreciates modestly (Anthropic marks firm, SpaceX steady), and the discount settles around ~5% as Saba's buyback discipline persists without a full closure event. No re-rating windfall and no write-down — just the book working over three years, which is the honest base for a trust already trading near par. NAV compounds from \$4.61 to ~\$6.05/sh by 2029; at a ~5% residual discount the share-price exit is ~\$5.75 nominal. PV at the 9.5% fund discount over three years: ~\$4.38 — about 3% above today. The modest premium to spot is the point: with the discount already compressed, the return now comes from NAV compounding, not the re-rating that drove the last two years.	SpaceX IPO; discount → par. WHY 18% Requires a SpaceX IPO (or a credible secondary at/above carry) inside the window plus continued public-book compounding plus a discount that closes rather than re-opens. Each 40-60% individually; jointly ~18%. A SpaceX listing is plausibly catalytic but timing is the binary — it could slip past 2029, which pushes this into the ultra-bull's longer horizon. WHAT HAPPENS The private sleeve crystallizes. A SpaceX IPO (toward \$1.6-1.75T) validates BG's carry rather than cutting it, the Anthropic mark continues to re-rate (it more than doubled from 3.3% to 7.4% in Apr-2026), and the public book compounds alongside. With the private marks proven and Saba's pressure intact, the discount closes to par — buybacks at a tightening discount stay NAV-accretive. NAV reaches ~\$7.40/sh by 2029 and the discount goes to ~0, so the share-price exit ≈ \$7.40 nominal. PV at the 9.5% fund discount over three years: ~\$5.64 — about 1.3× today. The upside is real but bounded: even crystallizing the single richest mark, the holder captures NAV compounding plus the last few points of discount, not a venture multiple.	SpaceX + Anthropic IPO above carry. WHY 7% Tail of tails. Both anchor names listing above carry AND a strong AI tape AND the discount flipping to a premium — a four-vector conjunction over a longer horizon. 5-10% feels right; 7% acknowledges the real optionality in the SpaceX + Anthropic marks without pretending two clean IPOs above carry are likely. WHAT HAPPENS The genuine tail. Both anchor private names list above carry — SpaceX at the top of its range and Anthropic via its own IPO above the 7.4% mark — while the US growth book runs with a strong AI tape. The discount not only closes but flips to a small premium as the market chases a trust that just printed two private-to-public windfalls; buybacks pause as the shares trade above NAV. NAV compounds to ~\$9.5/sh and a small premium puts the four-year share-price exit near \$10.0 nominal. PV at the 9.5% fund discount over four years: ~\$6.96 — about 1.6× today. It contributes a meaningful slice of weighted value despite only 7% probability, but it is bounded by being a fund, not a single moonshot: the tail is two IPOs landing right, not one company going parabolic.

Bear \$3.08 Base \$4.38 Bull \$5.64

PUSHBACK · WHY THE BASE CASE IS TOO HARSH

- 1

The easy re-rating is already spent.
Saba compressed the discount from ~20% (2023) to ~2-3%, vs the ~20.8% AIC peer average — little discount left to harvest.
- 2

The private marks are rich, not conservative.
BG marks SpaceX at ~\$1.6T vs Morningstar's ~\$780B (~2×); SpaceX + Anthropic ≈ 24% of NAV in two illiquid marks — concentration + valuation risk.
- 3

The 5-year record lags badly.
5-yr annualised NAV +3.9% vs benchmark +14.5% (the 2022 crash); the recent recovery isn't yet a re-rating of the manager.
- 4

Saba is catalyst and risk in one.
~29% stake forces buybacks/tenders that keep the discount tight — but a Saba exit/wind-down is the single largest re-widening trigger.

FALSIFICATION TRIGGERS

Bear validation US growth drawdown ≥20% · SpaceX/Anthropic marks written toward third-party fair value · Saba exits and the discount re-opens past ~12%	Bull validation SpaceX IPO at/above carry · Anthropic mark re-rates again · discount holds ≤5% on sustained NAV-accretive buybacks	Reframe needed A Saba-forced wind-down/continuation vote — converts the thesis from "narrowing discount + compounding" to a one-time NAV-realization event, collapsing the holding period and the distribution.

GLOSSARY · CONCEPTS REFERENCED IN THE NARRATIVE

NAV (net asset value) — Per-share portfolio value (assets minus liabilities). For USA ~343.91p (\$4.61) — the yardstick a closed-end fund is measured against.	Discount / premium to NAV — Gap between share price and NAV. USA trades ~2-3% below NAV; closing the discount is return independent of the portfolio.	Closed-end investment trust — A UK listed fund with a fixed share count, so the price floats on supply/demand and can diverge from NAV (unlike an open-end fund).
The private sleeve / unlisted holdings — The ~30-40% of assets in unlisted companies (SpaceX, Anthropic, Stripe, Databricks), manager-valued between funding events — illiquid and mark-dependent (mandate allows up to 50%).	Saba Capital (activist) — An activist holding ~29% of USA, pressing discount-control (buybacks, tenders) — both why the discount is tight and a re-widening risk if it exits.
