

THE CENTRAL QUESTION

Can IonQ capture meaningful share of a \$50B global quantum TAM by 2036 with its trapped-ion stack — or is a \$13B market cap pricing certainty Quantinuum, Google, and neutral-atom don't support?

IonQ trades at ~\$13B against a \$260-270M FY26 guide — P/S ~50× after July's sector de-rating halved the quantum complex (no adverse IonQ filing). \$2.39B cash + \$470M RPO + the \$1.8B SkyWater chip-fab deal (FTC review pending) is the optionality. Trapped-ion gives ~99.9%+ 2Q fidelity; AQ#64 hit three months early. But the competitive set is brutal: Quantinuum IPO'd at >\$14B with better logical-qubit performance, Google's Willow demonstrated verifiable advantage on chemistry, and neutral-atom scaled past 1,200 qubits. Honest math: cash-feasible raise schedules force heavy dilution before commercial inflection. Five scenarios, weighted; show your work.

PROBABILITY-WEIGHTED EXPECTED VALUE

0.29× spot	0.42× spot	0.60× spot	0.86× spot

WEIGHTING RATIONALE

Ultra Bear 10% Trapped-ion scaling wall + Quantinuum dominance + commercial quantum advantage delayed past 2030; equity wipes via dilution.

Bear 30% Quantinuum's IPO + better logical qubits push IonQ to #2 within trapped-ion; smaller TAM than consensus.

Base 42% Sequential execution on roadmap; co-leader duopoly with Quantinuum at ~8% TAM share and 17% mature margin.

Bull 15% Vertical SkyWater integration pays off; IonQ wins trapped-ion premium and platform race.

Ultra Bull 3% Tail of tails: Nvidia-of-quantum + TAM upside + competitor stumbles + multiple expansion.

Bull (15%) + Ultra Bull (3%) together contribute \$7.74 — 85% of the \$9.07 expected value despite 18% combined probability. Today's spot (\$44.86) sits 395% above the weighted expected; forward-weighted value crosses spot between +5y and +10y.

IonQ scenario narratives

PROBABILITY WEIGHTS

Ultra Bear 10% Bear 30% Base 42% Bull 15% Ultra Bull 3% · Weighted expected \$9.07 (-79.8% vs spot)

ULTRA BEAR	\$0.55	BEAR	\$0.85	BASE	\$2.42	BULL	\$25.76	ULTRA BULL	\$129.21
	-98.8% vs spot		-98.1% vs spot		-94.6% vs spot		-42.6% vs spot		+188.0% vs spot

Probability 10%

Trapped-ion sidelined; equity wiped.

WHY 10%

10% reflects three compounding tail risks specific to trapped-ion: fundamental scaling ceiling around 100-500 qubits — credible physicists still debate this; Quantinuum's commercial dominance within the trapped-ion category after its >\$14B Jun 2026 IPO; the broader risk that "useful" quantum advantage stays elusive through 2030, starving the whole sector. Each individually 25-35%; conjunctive 8-12%. The FTC's pending Second Request on SkyWater adds a live blocked-deal branch to this tail.

WHAT HAPPENS

Structural failure. Quantum advantage on commercial problems takes longer than the bull-deck slides project (BCG's revised "broad advantage 2030-2040" view); the NISQ era stays a science-fair through 2030. IonQ burns \$400-600M annually to AQ#256 with no commensurate revenue ramp. Worse, trapped-ion architecture hits a fundamental scaling wall around AQ#100: ion-shuttling complexity, vacuum-chamber engineering, and laser-stability budgets all degrade nonlinearly. Quantinuum's H-series, with the same physics and Honeywell's industrial-scale manufacturing, edges ahead and consolidates the trapped-ion niche.

Meanwhile superconducting (IBM Nighthawk, Google Willow) achieves first verified commercial advantage at a price IonQ can't match per-shot. Neutral-atom scales past 2,000 atoms by FY28 and wins the cost curve. The FTC blocks the SkyWater deal, so there is no captive fab — and no fab to salvage. IonQ's \$470M RPO converts but never grows; FY30 revenue stalls below \$400M against \$500M+ cash burn. Cash exhausts mid-2029. Successive raises from \$28 down to \$2 roughly triple the share count; by FY32 IonQ is taken private at a token premium. With 60% within-scenario p_fail, distress recovery ~\$0.80. Expected per share ~\$0.55.

Probability 30%

Quantinuum wins; IonQ #2 niche.

WHY 30%

Quantinuum's completed Jun 2026 IPO — priced above range at a >\$14B valuation, \$1.68B raised — with materially better logical-qubit performance (48 logical at 99.92%) is a real competitive shift — Honeywell mfg + Cambridge Quantum SW is the most credible full-stack competitor. The broader quantum TAM consistently underperforms forecasts. IonQ executes technically but the pie is smaller and Quantinuum eats the premium slice. Within-scenario 18% p_fail reflects that even in the bear world, IonQ's cash position and DARPA contracts likely prevent bankruptcy. 30% weight reflects high-base-rate competitive entry has already happened.

WHAT HAPPENS

Execution exists but the market shape disappoints. IonQ delivers AQ#256 by 2027, but the FTC's April 2026 Second Request ends with the SkyWater acquisition blocked or abandoned — no captive fab, no 200K-qubit chip in 2028; the \$2.39B cash stays put. Commercial demand stays government- and research-heavy: DARPA QBI, DOE, NQI, a handful of pharma POCs. A Feb 2026 short report alleging most 2022-24 revenue was Pentagon-tied (contested, unconfirmed by any filing; partially offset by the MDA SHIELD and DARPA HARQ wins) is the sharpest dated evidence for that demand shape. Quantinuum's deeper logical-qubit lead wins enterprise mind-share post-IPO; IonQ becomes the credible #2 in trapped-ion, losing the big AWS/Azure/GCP enterprise-deployment race to superconducting.

Revenue ramps to ~\$1.4B FY36 — strong absolute growth but tiny vs bull-deck \$5B+. Without the fab, IonQ rents external foundry capacity and the margin ceiling drops. Operating margin matures around 8% — better than legacy services but well below cloud-software economics the current multiple implies. Cash burn averages \$300-400M through FY29; two raises (\$400M + \$1.0B) at \$30-20 prices — cash-feasible from a \$35 stock — add ~58M shares. Final ~432M. With 18% within-scenario p_fail, DCF/share ~\$0.93; expected ~\$0.85.

Probability 42%

Co-leader w/ Quantinuum; ~17% mgn.

WHY 42%

Highest single bucket because the base requires no breakthrough — sequential execution on plans in motion (Tempo shipping, SkyWater vertical integration, AQ roadmap ahead of schedule, DARPA QBI participation, RPO converting). Coexistence with Quantinuum mirrors duopoly outcomes in adjacent deep-tech markets (AMD/Intel, ASML/Nikon). 42% sits below typical 50-55% base weights because quantum has more genuine tail risk than most categories — thin middle ground between "works commercially" and "doesn't." Five- scenario structure with fatter tails forces base weight down.

WHAT HAPPENS

Modal outcome. IonQ executes the published roadmap roughly on schedule: AQ#64 done, AQ#256 by 2027, SkyWater fab chips back in 2028, the 200K-qubit-chip class reached 2028-29. Quantinuum is a credible co-leader; the trapped-ion sub-segment becomes a duopoly (~50/50 share), with IonQ winning roughly half the US government, defense, and large-enterprise quantum-cloud business via existing AWS Braket / Azure Quantum / GCP integration. Neutral-atom takes cost-sensitive optimization; superconducting takes most "deep stack" enterprise via IBM/Google brand.

By FY36 IonQ does ~\$3.8B revenue (~7.6% of \$50B TAM) at 17% mature operating margin — better than legacy hardware but below cloud-SaaS. SkyWater fab supplies internal demand plus third-party defense- electronics revenue. RPO converts steadily; multi-product customer share rises 35% → 60%+. Cash burn troughs at ~\$350M in FY28; a \$2.5B raise programme across years 1-7 at \$35-65 — starting at spot, recovering as milestones land — keeps cash≥0. SkyWater stock-portion dilution (~25M) folded in. Final shares ~451M. DCF/share ~\$2.55; with 12% within-scenario p_fail, expected ~\$2.42 — well below today's ~\$35 spot.

Probability 15%

Trapped-ion wins; full-stack mgn.

WHY 15%

Chain of conditionals: AQ#256 ~on schedule (~70%), SkyWater 200K-qubit chip delivered 2028 (~60%), IonQ — not Quantinuum — captures the trapped-ion premium position (~50%), trapped-ion beats neutral-atom and superconducting on commercially relevant workloads at scale (~50%), DARPA/DOE flows weighted to IonQ (~60%). Each individually plausible; joint ~6-8% before correlation; correlated upward to ~12-18% because conditional outcomes reinforce. 15% is a real but non-modal tail.

WHAT HAPPENS

Trapped-ion is correct architecture and SkyWater compounds. By 2028 vertical integration via SkyWater proves out: the 200K-qubit chip arrives on schedule, error correction works, and IonQ demonstrates verifiable commercial quantum advantage on a customer workload (likely chemistry or optimization for a Fortune 50). Quantinuum stays credible #2 within trapped-ion but IonQ's vertical fab + cloud-native distribution wins the platform race. Neutral-atom struggles with fault tolerance; superconducting stalls between AQ-equivalent #500 and #2000 due to error-correction overhead.

Revenue ramps to ~\$8B FY36 (~16% TAM share) with 27% mature operating margin — the SkyWater fab is now monetizing third-party customers as the dominant US trusted quantum-chip foundry. DARPA HARQ scales into a multi-billion national-security program. Federal NQI funding flows disproportionately to IonQ. Cash burn troughs FY28 then turns positive by FY30. A \$3.4B raise programme across years 1-7 at \$45-75 keeps cash≥0. Final shares ~457M. DCF/share ~\$28; with 8% within-scenario p_fail, expected ~\$26.

Probability 3%

Nvidia-of-quantum; premium re-rate.

WHY 3%

Conjunctive bull chain × TAM upside × multiple expansion × competitor collapse. Each piece individually 40-60%; joint ~3-5%. Genuine tail capturing the world where quantum becomes a category- defining tech platform and IonQ is the dominant US pure-play. The asymmetrical-moonshots tier's reason-for-being: real upside that you can't get to without it.

WHAT HAPPENS

Tail of tails. Every Bull condition hits AND the FY36 TAM is materially larger than consensus (Roots Analysis \$198B FY40 trajectory, McKinsey upper-bound \$72B by 2035 just for computing) AND IonQ achieves de facto platform monopoly in trapped-ion + becomes a meaningful chip foundry via SkyWater. Quantinuum struggles with IPO-era execution; superconducting hits fault- tolerance walls that trapped-ion's higher native fidelity sidesteps. IonQ becomes the "Nvidia of quantum" — vertically integrated, full-stack, with AWS/Azure/GCP installed customer base creating a software flywheel.

By FY36 IonQ does \$16B+ revenue at 33% mature operating margin (full-stack hardware + cloud + software-take-rate on partner apps). SkyWater fab serves the entire US national-security stack. Multiple expansion to software-hybrid premium. Modest \$3.1B raise in years 1-6 at \$55-90 maintains runway. Final shares ~441M. DCF/share ~\$134; with 4% p_fail, expected ~\$129.

Arena. The race to a ~\$50B FY36 fault-tolerant quantum-computing TAM — trapped-ion (IonQ, Quantinuum) vs. superconducting (Google, IBM) vs. neutral-atom (QuEra, Pasqal, Atom Computing).

POWER ORIGATION
origination window: open

POWER ORIGATION · 7 POWERS

Scale Economies	SkyWater fab vertical integration begun; not yet a cost-curve advantage.
Network Economies	No developer/data flywheel; cloud reach via AWS/Azure is rented, not owned.
Counter-Positioning	Trapped-ion stack incumbents can't pivot to without abandoning sunk superconducting fabs.
Switching Costs	\$470M RPO; algorithms compiled to IonQ's native gate set raise re-port cost.
Branding	Strong research credibility (AQ#64 early); not yet the enterprise default.
Cornered Resource · thesis leans here	Trapped-ion IP portfolio + SkyWater fab; Maryland/Duke talent lineage.
Process Power	Fidelity yield improving each generation; not yet a durable, opaque process edge.

COMPETITIVE READ

Real trapped-ion cornered-resource and counter-positioning leads, but network and scale power are unoriginated and Quantinuum's logical-qubit edge is the falsifier to watch; the origination window is open, but not indefinitely.

Niccolo de Masi

1 yrs in seat

3.5%

insider ownership

MEDIUM

key-person risk

Capital allocation (realized)
Niccolo de Masi became CEO in February 2025 (a director since 2021, from the SPAC-sponsor family that took lonQ public) and added the Chairman role in August 2025 when prior CEO Peter Chapman exited the board. Both academic co-founders had already left (Christopher Monroe 2023, Jungsang Kim 2024). Capital allocation is an aggressive, equity-funded acquisition roll-up: ~\$3.5B cash pro forma after a \$2B October 2025 raise, with mostly-stock deals (Oxford Ionics ~\$1.06B, SkyWater ~\$1.8B, plus Lightsynq/Qubitek/ID Quantique) driving heavy dilution. No dividend or buyback.

Incentive alignment
CEO pay is overwhelmingly equity (the exact Summary-Compensation-Table figure was not retrievable; an aggregator put it near \$90M). After ~64% say-on-pay support in 2025, the committee shifted PSU weighting toward revenue and cut maximum payouts. Insiders sold heavily in 2025 (~\$400M, including ~\$269M by the departing prior CEO and ~\$105M by de Masi); 2026 selling is smaller, mostly RSU tax withholding. Insider ownership is a derived ~3-4% (it was ~11.6% in 2024 before the share count nearly doubled).

GOVERNANCE FLAGS

- single class of common stock, one vote per share — no super-voting, no controlling shareholder (largest holders Vanguard ~10%, BlackRock ~8%)
- combined Chair & CEO (de Masi consolidated both in August 2025) with no confirmed lead independent director since early 2025 — an independent-oversight gap
- classified / staggered board (three classes) — an entrenchment feature
- both academic co-founders departed (2023, 2024) and the prior CEO fully exited (2025) — wholesale leadership turnover
- recurring say-on-pay pushback (~64% support in 2025) and ~\$400M of 2025 insider selling
- aggressive stock-funded acquisition roll-up — repeated, material dilution

PEOPLE READ

The structural positive is genuine — one share, one vote, no controlling block, so shareholders are not disenfranchised. But this is a weak 3 on practice: a combined Chair/CEO with no confirmed lead independent director, a classified board, a ~64% say-on-pay vote, ~\$400M of 2025 insider selling, and a strategy concentrated in a CEO of under two years pursuing a heavily dilutive acquisition roll-up. Key-person risk is moderate — the science survived both founders’ departures, so it is the governance concentration, not individual dependence, that is the bigger flag.

Deal

Open-market common — entry price weighed against the probability-weighted fair value (the -74.4% finding) + position sizing.

lonQ supporting analysis · disclaimers · glossary

Bear \$0.85 Base \$2.42 Bull \$25.76

PUSHBACK · WHY THE BASE CASE IS TOO HARSH

- 1

Best-capitalized pure-play.
\$2.4B cash + \$470M RPO + SkyWater vertical integration. Multi-year runway with optionality no other public quantum has.
- 2

AQ#64 hit early.
Tempo achieved AQ#64 three months ahead of schedule — first to do so. Real execution beats slideware.
- 3

Federal tailwind is real.
DARPA QBI Stage B + HARQ + DOE/NQI's \$2.7B/5yr authorization disproportionately benefits US-based trusted-supply players.
- 4

Trapped-ion fidelity moat.
Industry-leading 2Q gate fidelity (~99.9%+) is a physics advantage, not process — hard for superconducting/neutral-atom to close.
- 5

Cloud distribution unique.
Available on AWS Braket, Azure Quantum, Google Cloud. Only Quantinuum has comparable reach; IBM/Google don't partner cross-platform.

FALSIFICATION TRIGGERS

GLOSSARY · CONCEPTS REFERENCED IN THE NARRATIVE

Trapped-ion qubits — lonQ's qubit modality — ytterbium ions in electromagnetic traps, manipulated by lasers. Highest gate fidelity but slower clock than superconducting.	AQ (Algorithmic Qubits) — lonQ's benchmark for usable capacity. AQ#N = circuits requiring 2^N states. AQ#64 hit 2026; AQ#256 targeted 2027.	Quantum advantage — Quantum solving a problem faster/cheaper than classical. Google's Willow demonstrated verifiable advantage on chemistry Oct 2025; no commercial advantage verified yet.
Quantinuum — Honeywell-backed full-stack trapped-ion competitor. IPO'd Jun 2026 at \$60 above range (>\$14B; trades as QNT, below issue); better logical-qubit performance (48 logical at 99.92%).	SkyWater — US semiconductor foundry lonQ agreed to acquire (~\$1.8B; FTC 2nd Request Apr 2026, unclosed as of Jul 2026). Domestic chip fab — the base/bull 200K-qubit-chip path rests on it.	Tempo / Forte — lonQ system generations. Forte = current commercial (AQ#36). Tempo = next-gen, AQ#64 demonstrated, 256-qubit chip.
